

Vocabulary Learning Support System Using LLMs & Video Generation AI

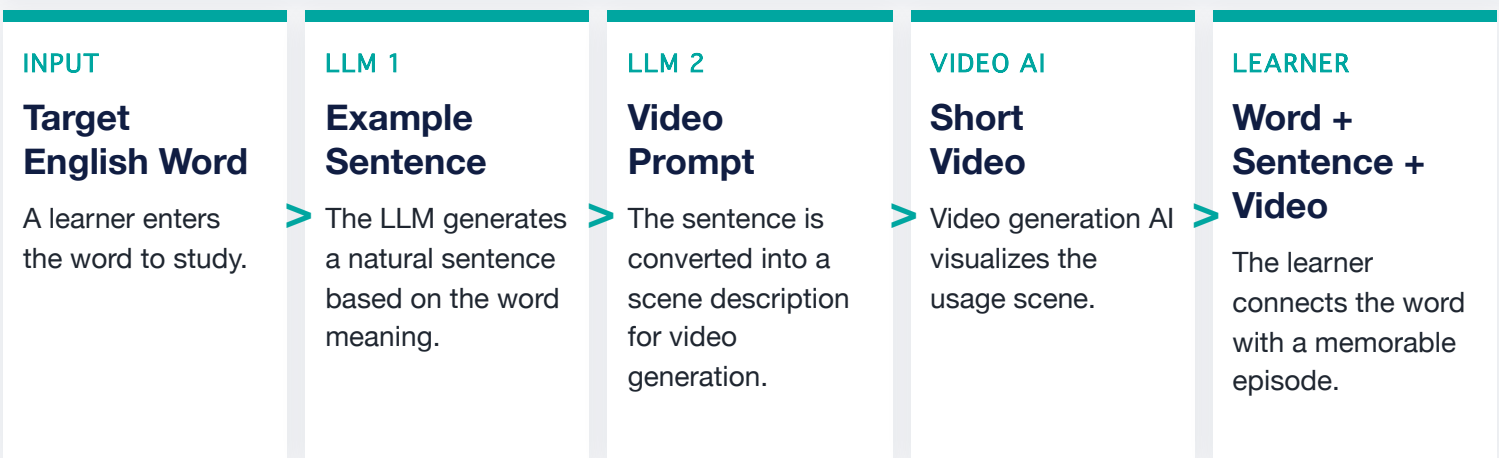

Learning English words through generated episodes and videos

BACKGROUND

- Engineering students need vocabulary for papers, technical documents, and tests.
- Word-book learning is text-based and often separates words from usage scenes.
- Episodic memory suggests that scenes and experiences can support memorization.

PURPOSE

- Connect English words with concrete usage scenes.
- Use LLMs and video generation AI to create learning episodes automatically.
- Support vocabulary learning that is more memorable than word-book learning.

What the system shows

- Target English word
- Meaning-based example sentence
- Short video of the usage scene

Current status

- Basic system design is being organized
- Video generation has been tested with some words
- Concrete action words are easier to visualize
- Abstract words are still difficult to express

Goal: make vocabulary learning more memorable than word-book learning.
